

Bachelor and master thesis projects studying the role of nuclear hormone receptors in inflammation and metabolism.

For potential master students, we highly encourage a 6-8 weeks internship before starting a master thesis in our lab.

Topics:

- Role of cellular metabolic state in gene regulation by the glucocorticoid receptor (focus on inflammation) (Greulich)
- Histone methyl transferases as anti-inflammatory targets (Greulich)
- Mechanisms of gene repression by the glucocorticoid receptor (Greulich)
- Role of testicular receptors in arteriosclerosis and macrophage inflammation
- Nuclear hormone receptors in *C. elegans* as modulators of lipid metabolism (Spanier)
- Nuclear hormone receptors in *C. elegans* as modulators of aging processes (Spanier)

Methods applied (depending on the project)

Bachelor projects:

- Expression analysis: RNA extraction, reverse transcription, quantitative PCR
- Cell culture: cell lines and primary cells
- Chromatin-immunoprecipitation qPCR
- Western blotting
- Protein expression, in-vitro enzymatic assays
- Luciferase assay
- Genetic engineering of recombinant cell lines
- Cloning
- *C. elegans*: RNA interference, lifespan, cloning, genetic crossings, Western Blot, PCR
- Bioinformatics analysis of next-generation sequencing data (theoretical thesis requires previous knowledge of R)

Master projects:

- CRISPR/Cas9-mediated mutagenesis in cell lines, genetic engineering
- Mouse work: organ harvest, histology, immunostaining, genotyping
- Chromatin-Immunoprecipitation-coupled with sequencing/PCR
- Cloning
- *C. elegans*: RNA interference, lifespan, body fat analysis, fatty acid analysis, cloning, PCR, qPCR, Western Blot
- NGS data analysis (previous knowledge of R and linux command line)
